

Nu-Wall Aluminium Cladding – Design for a Weathertight Future

Nu-Wall Aluminium Cladding is manufactured in New Zealand for supply to construction projects throughout Australasia and around the world. Originally launched by Comalco over twenty years ago as a low-maintenance alternative to painted timber weatherboards, Nu-Wall has been continuously developed to accommodate a wider aesthetic offering, while keeping pace with the requirements of the New Zealand Building Code. Nu-Wall offers the ultimate solution for long-term durability with low maintenance.

Design with Nu-Wall – Nu-Wall offers 12 different main cladding profiles to select from, ranging from traditional weatherboard styles through contemporary ripple and aerofoil textures to flat, commercial facades. In addition to a wide range of standard powdercoat or anodised finishes, colours are also able to be custom-matched to the requirements of any project. The ability to install the cladding profiles in either horizontal or vertical orientation provides yet another opportunity to create your own individual style. With such a wide range of options, Nu-Wall offers a creative opportunity unmatched by other cladding material. To learn more about Nu-Wall profiles and colours http://www.aluminium.co.nz/nu-wall_profiles_and_colours_horizontal.htm

Weathertight with Nu-Wall – Nu-Wall offers a total exterior cladding system which has been developed to meet or exceed the requirements of the current New Zealand Building Code. BRANZ have tested Nu-Wall and have verified its suitability for use as an exterior cladding under current building regulations, issuing three distinct Appraisals covering all applicable installation methods. As well as offering you peace of mind when selecting Nu-Wall for your project, you can be assured that your local Council will view the product favourably when assessing your Building Consent application. Because it is regarded as a durable, weathertight exterior cladding solution, Nu-Wall has become the product of choice for many Specifiers working on projects to remediate leaky buildings.

The Future with Nu-Wall – Nu-Wall extruded aluminium weatherboards are extremely durable and will outlast the life of a building, while the finishes applied to them will retain their smart appearance for years with only minimal maintenance, even in harsh coastal situations. At the end of the building's life, the aluminium will be fully recyclable; the screw-fixing method facilitating removal of the weatherboards for this purpose. Hence, in addition to being a sensible choice for the future of your home, Nu-Wall is also a responsible choice for the future of the environment.

Progetti Style Incentive
